

Tailwind CSS Cohort Agenda

Day 1: Tailwind CSS Fundamentals

Agenda

1. Prerequisites for learning about tailwind css
2. Tailwind CSS: what it is
3. Why Tailwind CSS?
4. What is a Library?
5. What is a Framework?
6. Bootstrap vs Tailwind CSS

Lesson Notes

Prerequisites

Before starting Tailwind CSS, it helps to know:

- Basic HTML
- Basic CSS
- How classes work in HTML
- A little JavaScript is helpful, but not required for the first session

Tailwind CSS: What It Is

Tailwind CSS is a utility-first CSS framework.

That means instead of writing custom CSS for every design, you use small utility classes directly in your HTML to build the layout and style.

Example idea:

- `flex` for flexbox
- `p-4` for padding
- `text-center` for text alignment
- `bg-blue-500` for background color

Why Tailwind CSS?

Tailwind CSS is useful because it:

- Speeds up development
- Reduces the need to switch between HTML and CSS files
- Keeps styling consistent
- Makes responsive design easier
- Works well for rapid prototyping and real projects

What is a Library?

A library is a collection of pre-written code that you call when you need it.

- You control the flow
- You decide when to use the code
- It helps you avoid writing everything from scratch

What is a Framework?

A framework gives you a structure to build within.

- It often controls more of the flow
- You follow its rules and patterns
- It provides a stronger foundation for building applications

Bootstrap vs Tailwind CSS

Bootstrap and Tailwind both help you style websites, but they work differently.

Bootstrap:

- Comes with ready-made components
- Faster for traditional UI building
- More opinionated design style
- Easier for quick standard layouts

Tailwind CSS:

- Gives utility classes instead of pre-built components
- More flexible and customizable
- Encourages building your own design system
- Better when you want unique, custom UI

Revision Summary

- Tailwind CSS is a utility-first framework.
- Libraries are called when needed; frameworks provide structure.
- Bootstrap is component-based; Tailwind is utility-based.
- Tailwind is great for speed, flexibility, and custom design.

Notes to Update Later

- Add examples
- Add mini practice tasks
- Add day-wise exercises
- Add recap points from class
